

## ABSTRACT

A printer for producing rolls of wallpaper has a housing in which is located a media path which extends from a blank media intake to a wallpaper exit slot. A multi-color roll width printhead located in the housing and across the media path. The printhead is supplied by separate ink reservoirs and the reservoirs are connected to the printhead by an ink supply harness. A disconnect coupling is placed between the reservoirs and the printhead. Inputs to the printer include one or more input devices for capturing operator instructions. A processor accepts the operator inputs and configures the printer for producing a particular roll.
